

Tree and Plant Solutions

Landscape Design's Arboriculture services are primarily focused on individual woody plants and trees planted and maintained for permanent landscape and amenity purposes, usually in gardens, parks or other populated settings. Arboriculture is the cultivation, management, and study of individual trees, shrubs, vines, and other perennial woody plants. It is both a practice and a science.

The practice of arboriculture includes cultural techniques such as selection, planting, training, fertilization, pest and pathogen control, pruning, shaping, and removal. Risk management, legal issues, and aesthetic considerations have come to play prominent roles in the practice of arboriculture.

Wherever you are, you are likely to encounter trees and plants. As well as offering significant value to our wellbeing and landscape environment a tree will need management at some stage in its life. This is particularly the case where changes to the surroundings are planned. Trees are very often protected by law particularly when associated with land development and planning applications.

Our range of services complements our consultancy and management business. Often our clients not only want our advice and recommendations but will ask us to implement the work we suggest. This we are pleased to do, thus offering a complete service for all tree, woodland and land management projects.

We offer the following services:-

- **Planting plans and maintenance reports**
- **Felling and tree surgery applications**
- **Species selection planning and ground condition reports**
- **General Health Assessment**
- **Tree Risk Management Reports**
- **Tree Mapping Plans and Arboriculture Surveys**
- **Tree Planting**
- **Tree Pruning**
- **Tree Removal**
- **Felling and Stump Grinding**
